

FGM/C IN BENIN: SHORT REPORT

June 2021

Key Findings and Indicators¹

Prevalence: In Benin, the prevalence of FGM/C in women aged 15–49 is 9.2%

Geography: The departments with the highest prevalence are in the north. Of Benin's 12 departments, five have a prevalence of less than 1%

Age: 85.3% of women aged 15–49 who have undergone FGM/C were cut before the age of 15

Type: 'Flesh removed' is the most common type of FGM/C practised

Agent: Almost all FGM/C is carried out by 'traditional agents' (including traditional cutters and birth attendants)

Attitudes: 86.3% of women aged 15–49 believe the practice should not continue

HDI Rank: 158 out of 189 countries (2019)

SDG Gender Index Rating: 109 out of 129 countries (2019)

Population: 12,427,818 (as of 8 June 2021), with a 2.69% growth rate (2021 est.)

Infant Mortality Rate: 31 deaths per 1,000 live births (2019)

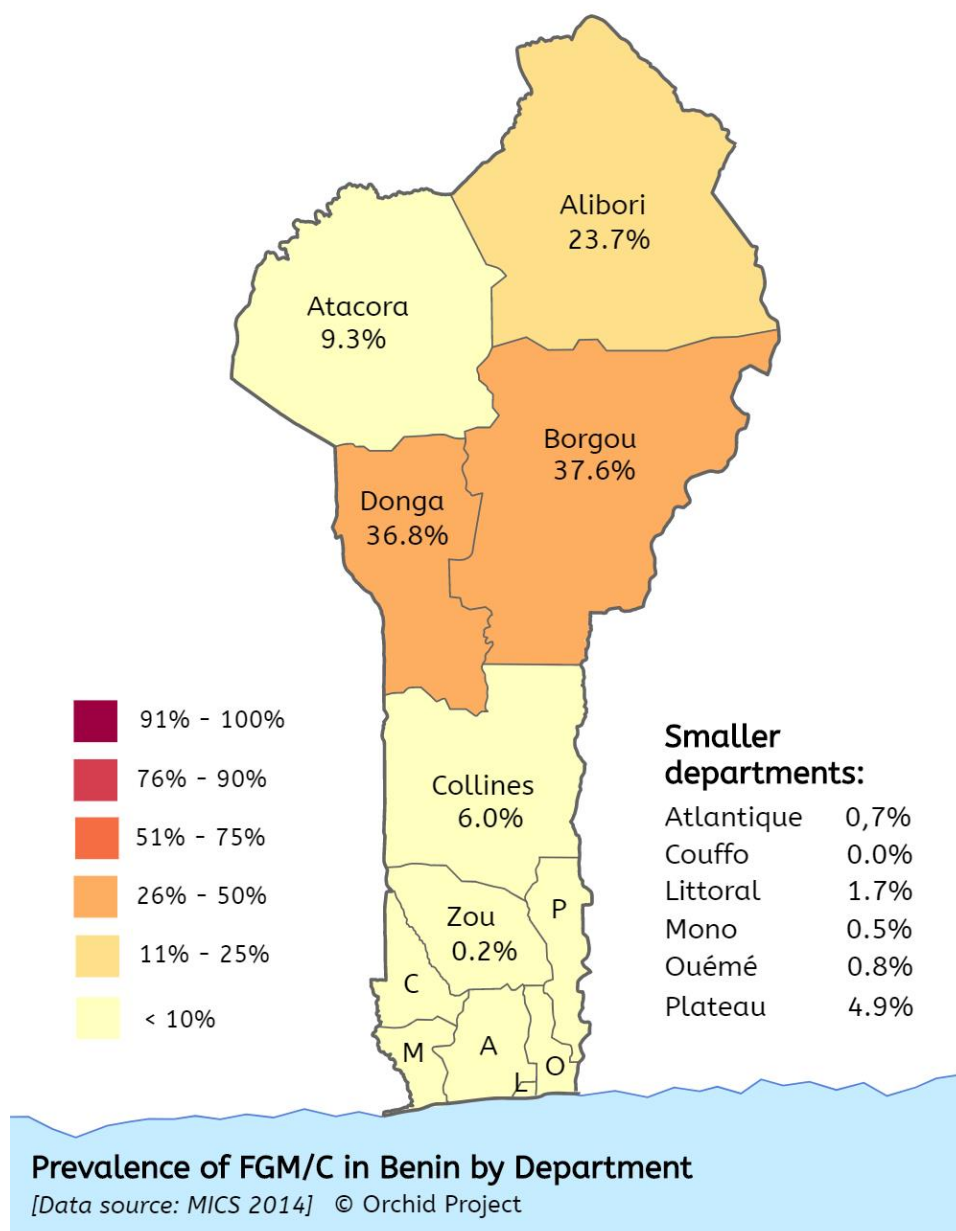

Maternal Mortality Ratio: 397 deaths per 100,000 live births (2017)

Literacy: 42.4% of the total population aged 15 and over can read/write

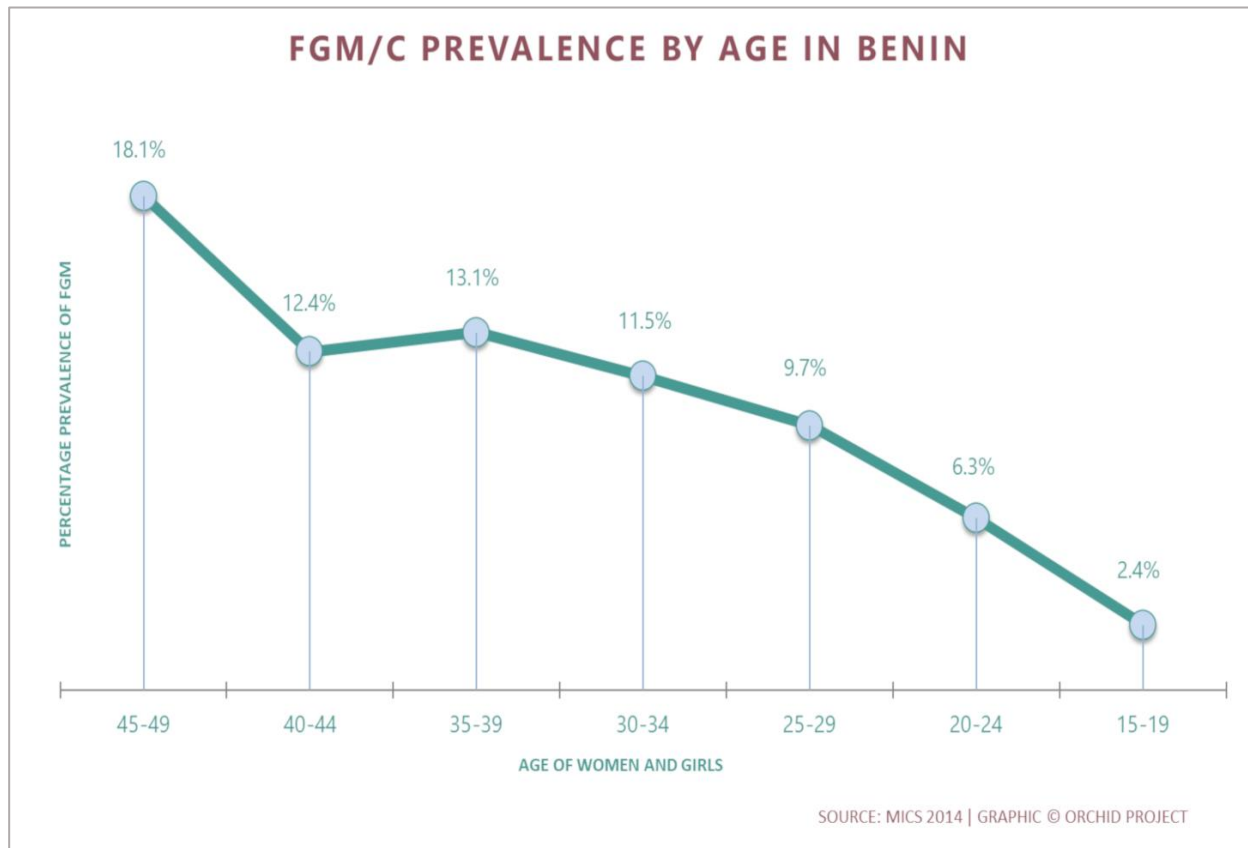

Prevalence of FGM/C

The departments in Benin with the highest FGM/C prevalence are in the north: Borgou (37.6%), Alibori (23.7%) and Donga (36.8%). There is a significant difference between these departments and the rest of Benin: all remaining departments have a prevalence of below 10%; five of these (Atlantique, Couffo, Mono, Oueme and Zou have a prevalence of less than 1%. The department with the lowest prevalence is Couffo, in which no instances of FGM/C were recorded. FGM/C is more common in women living in rural areas (13.1%) than in those living in urban areas (5.2%).

FGM/C appears to be practised more by Muslims (27%) than by people of other religions, and there is a wide variation in levels of practice between ethnic groups: over 40% prevalence among the Bariba and Peulh, and less than 1% among the Adja and Fon.² Only 4.5% of women and 6.2% of men (aged 15–49) who have heard of FGM/C believe that the practice is required by their religions.³

Trends in FGM/C Prevalence

Between 2006 and 2011/12, the overall prevalence among women aged 15–49 fell from 12.9% to 7.3%. In 2014 the prevalence was recorded as 9.2%.⁴ Due to statistical fluctuations in the data, however, the most recent measurement of prevalence is unlikely to reflect a true increase.

Due to the large age-range of women included in the DHS and MICS surveys, the overall prevalence alone may not fully reflect the progress that has been made in recent years. Breaking down the most recent data by age group shows that the prevalence among women aged 45–49 is 18.1%, while for the youngest age group this has fallen to just 2.4%. Despite the fact that a small proportion of women may be cut after the age of 15, the data demonstrates a clear trend towards a lower prevalence among younger women.⁵

Cross-Border FGM/C

In some countries where FGM/C has become illegal, the practice has been pushed underground and across borders to avoid prosecution. Media reports suggest that families from Benin are still crossing borders to have their girls cut; Burkina Faso, Niger, Nigeria and Togo are all mentioned as possible destinations. According to one local activist in the north-eastern border town of Ségbana, for instance, people from local farms ‘regularly cross the border to get cut in Nigeria.’⁶

Medicalised FGM/C

The medicalisation of FGM/C does not appear to be significant in Benin, according to available data: only 0.2% of women aged 15–49 are reported to be cut by a health professional.⁷

Legislation

The first – and main – law prohibiting FGM/C is **Law No. 2003-03 on the Suppression of Female Genital Mutilation in the Republic of Benin**, issued on 3 March 2003.⁸

This was reinforced by later laws:

- **Law No. 2011-26 on the Prevention and Repression of Violence Against Women** (January 2012)⁹ – this law has a wider application as Article 2 prohibits ‘all acts of violence against any female . . . leading or possibly leading to damage or any physical, sexual or psychological pain’ and specifically refers to FGM/C under the main Law 2003-03.
- **Law No. 2015-08 of the Children’s Code in the Republic of Benin**¹⁰ – **Section IX, Articles 185–188** refer directly to FGM/C performed on children.

There is a lack of evidence, however, of any FGM/C cases having been prosecuted under these laws.

Work to End FGM/C

Evidence suggests that there has been progress towards ending FGM/C in Benin through local grassroots projects as well as anti-FGM/C programmes funded from international sources. Government departments have previously supported non-governmental organisations’ (NGOs) information campaigns as part of ongoing efforts to end the practice.

The introduction of legislation and related penalties in 2003 and a crackdown on cross-border movement were considered to have sent out a strong message. However, recent reports suggest that the practice may have gone underground and that some cutters who had abandoned the practice have resumed their work. Girls are also reportedly still being taken across borders to undergo FGM/C (which is not specifically addressed under current laws).¹¹
